Urmack Watch — Product Designs

v1.0 · 16 Oct 2026 · Four core screens, designed in the Urmack system (Obsidian / Signal Lime / Graphite · Space Grotesk / Inter / JetBrains Mono). These are design specifications for build, not screenshots of working software.

Screen 1 — Protocol health dashboard

Landing screen after sign-in. Answers "is anything at risk right now?" in under three seconds: global status, margin pressure, live alert feed. Margins — not just pass/fail — are the product's core visual language.

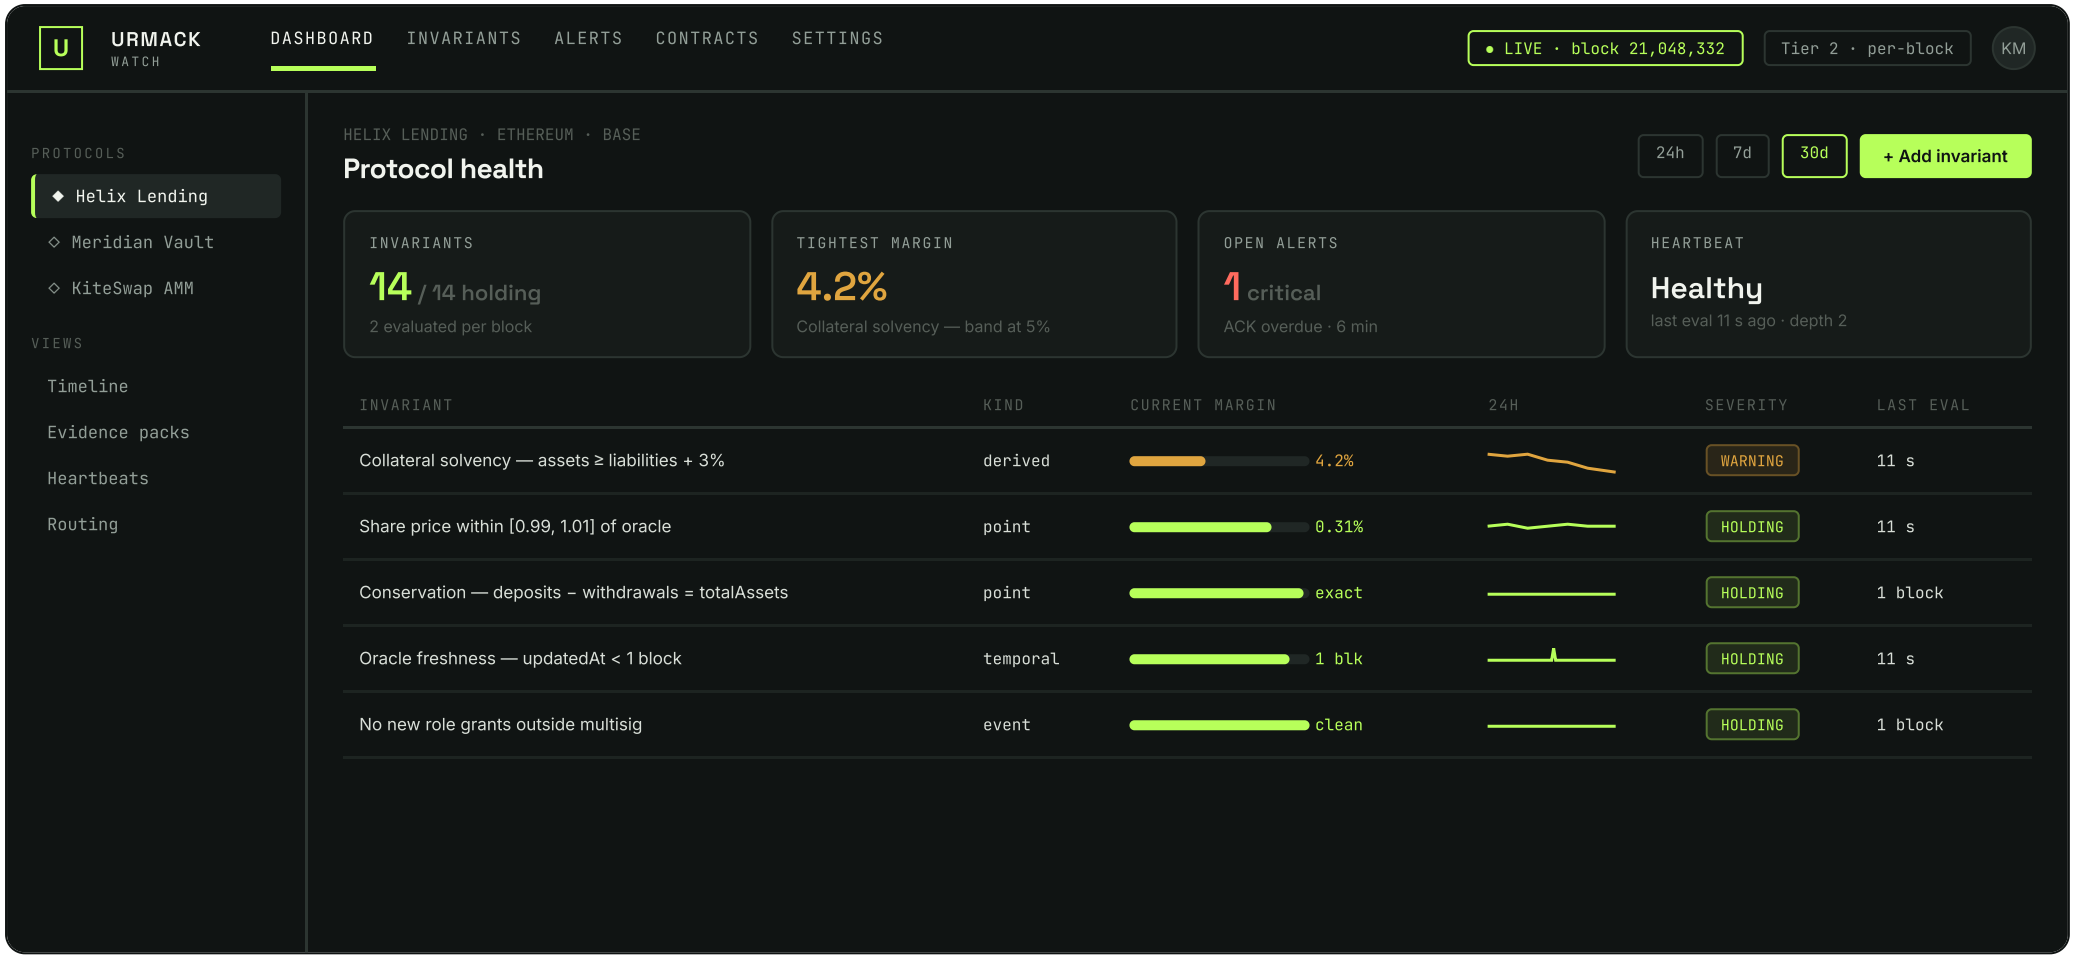

FIG 1.1 — DASHBOARD / PROTOCOL HEALTH

DESIGN SPEC · DESKTOP 1440

Margin, not binary
Pass/fail hides risk trajectory. Every invariant shows how much headroom remains, with the warning band pre-drawn.

Block clock in chrome
The live block counter grounds every number in chain time — investigators always know "as of when."

ACK overdue inline
The critical alert counter doubles as an accountability nudge; unacked criticals are visible without opening Alerts.

Screen 2 — Invariant editor with dry-run

Template-first authoring: pick a vetted template, fill protocol-specific parameters, watch it tested against 7 days of real history before it can be armed. The dry-run gate is the false-positive prevention mechanism from Flow 2.

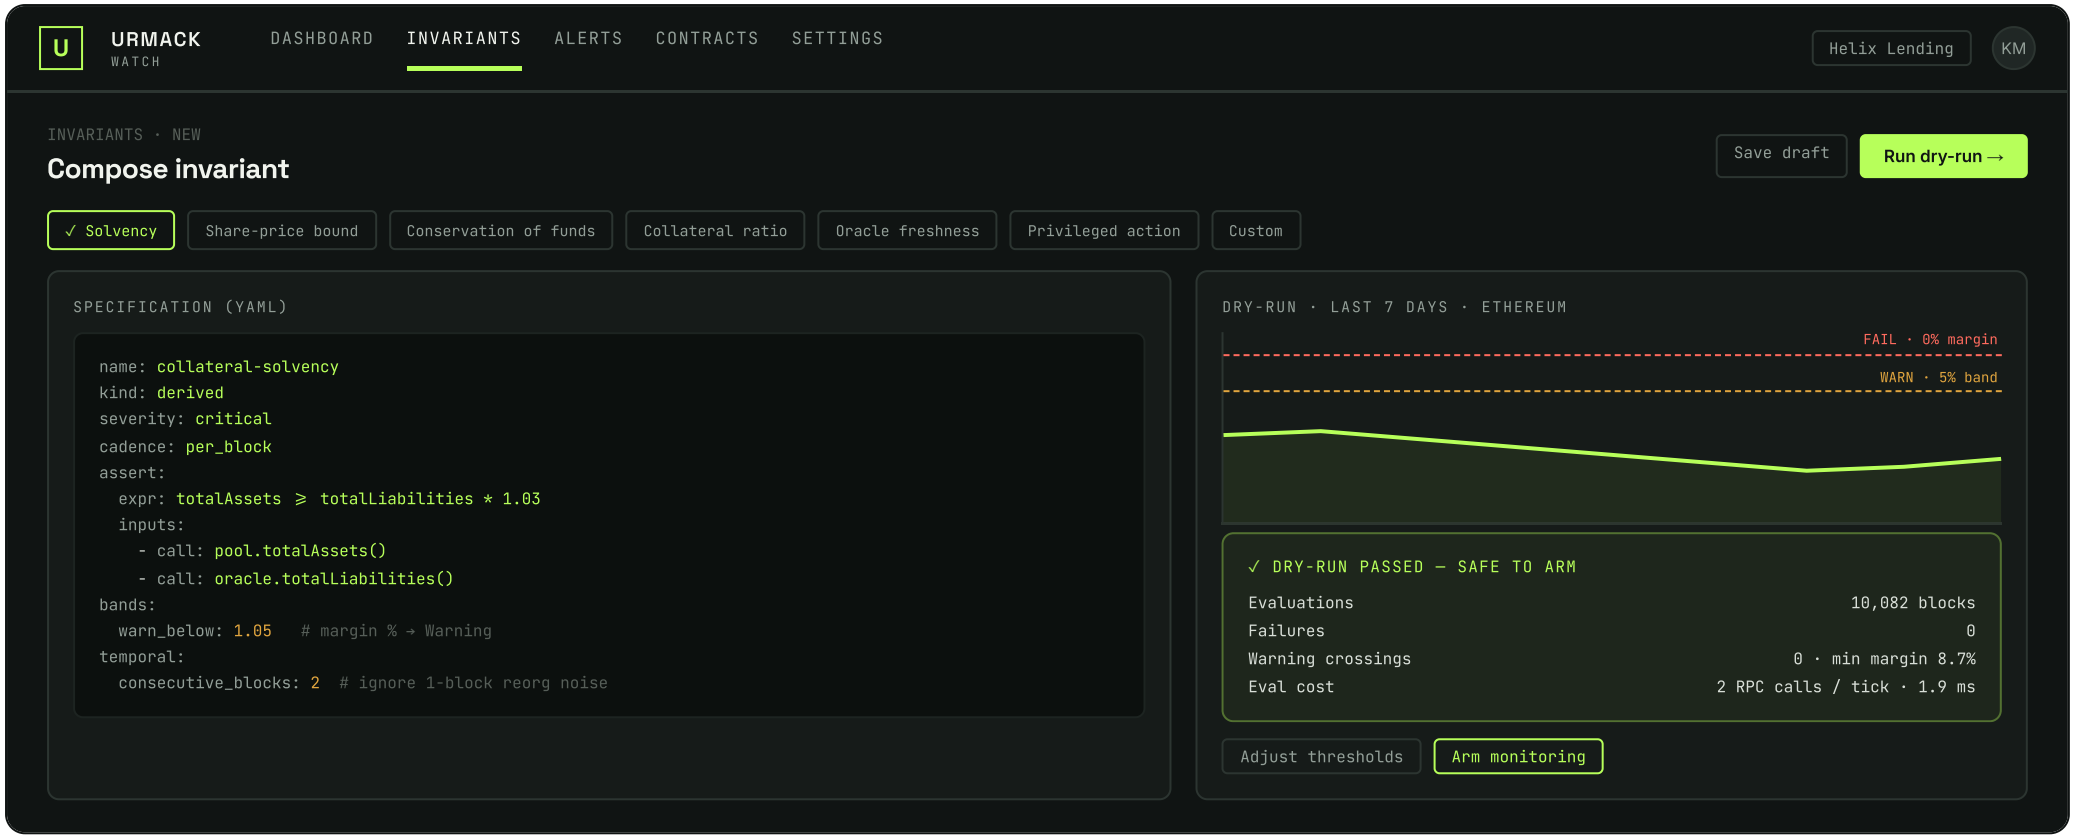

FIG 2.1 — INVARIANT COMPOSER / DRY-RUN

DESIGN SPEC · DESKTOP 1440

Templates carry Urmack's research
Each template encodes vetted economic reasoning; "Custom" exists but is visually secondary — most users should never hand-write YAML.

Arming is gated
"Arm monitoring" only activates after a passing dry-run; the button state enforces the Flow 2 gate in the UI.

Cost transparency
RPC calls per tick shown upfront — monitoring cost predictability is a buyer objection, answered before it's asked.

Screen 3 — Alert detail & evidence pack

The screen an engineer lands on from a PagerDuty/WhatsApp ping at 3 a.m. Everything needed to decide "real incident or noise" in one view; the evidence pack is downloadable for IR hand-off.

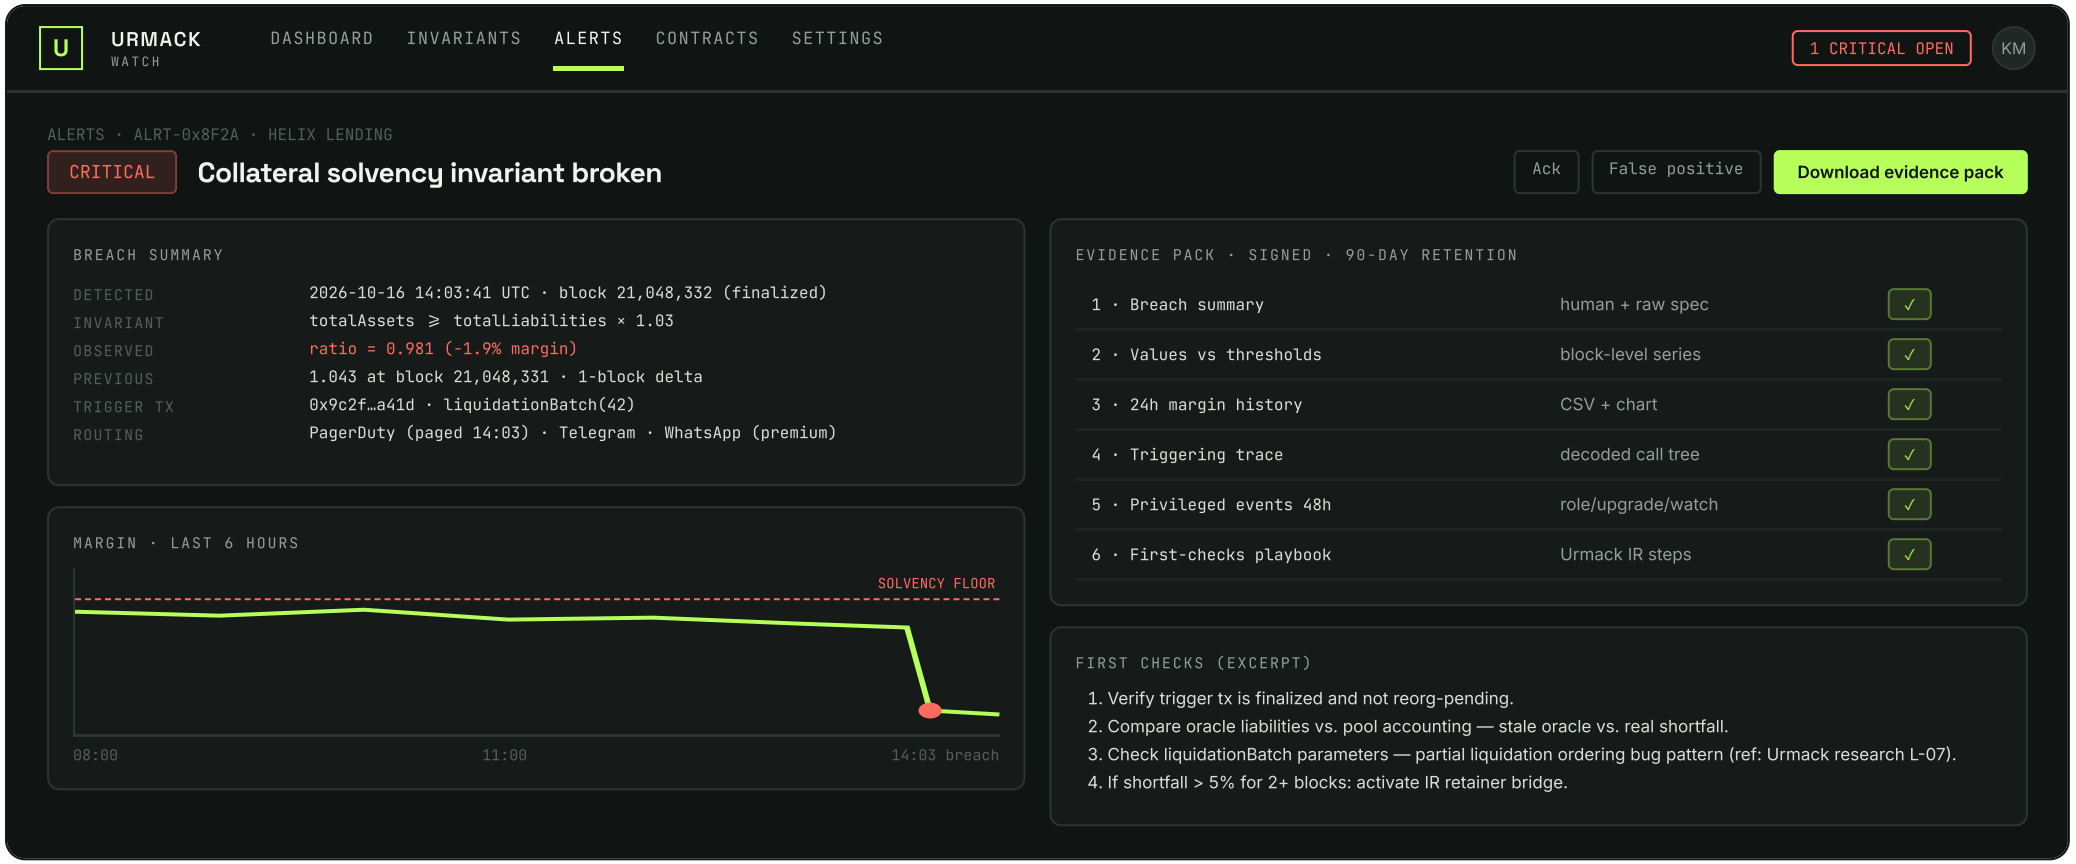

FIG 3.1 — ALERT DETAIL / EVIDENCE PACK

DESIGN SPEC · DESKTOP 1440

Delta context is default
"What changed since last block" answers the first forensic question without any clicking.

Evidence as a product
The signed, downloadable pack is the upsell surface into IR retainers — and what makes alerts defensible in postmortems.

Playbook cites research
Linking first-checks to Urmack research turns the portal into a distribution channel for the firm's thought leadership.

Screen 4 — Onboarding wizard (dry-run step)

Self-serve onboarding from Flow 2. Step 3 — the dry-run gate — is given the most screen space because it is the step that determines whether the customer's first week is silent-and-trustworthy or noisy-and-uninstalled.

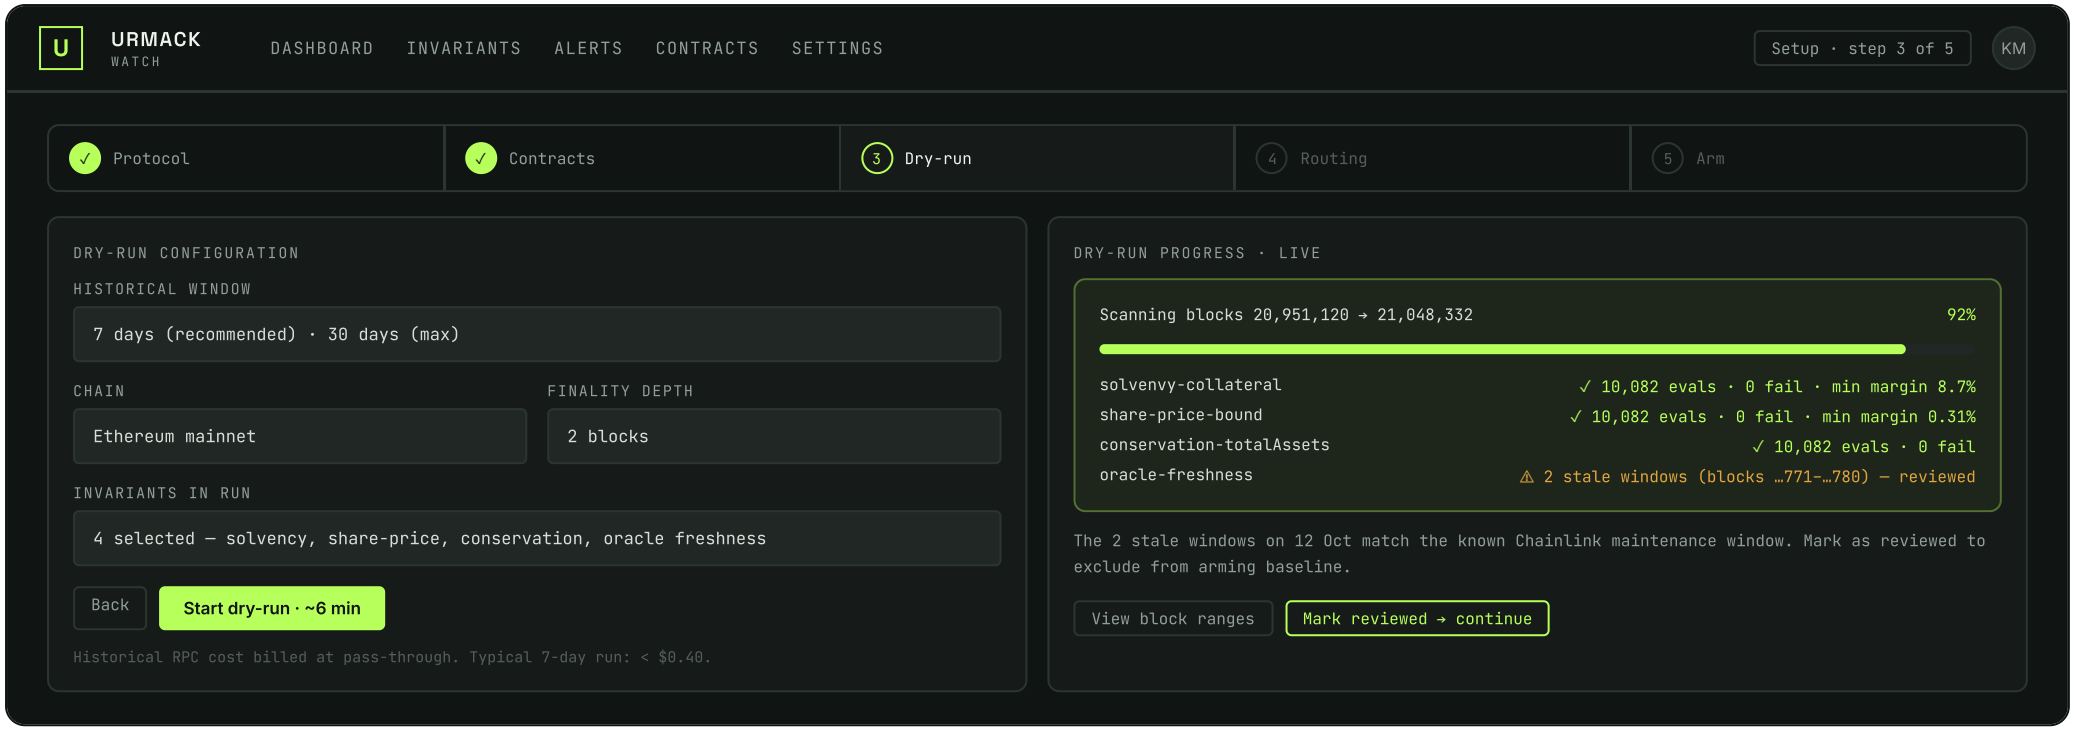

FIG 4.1 — ONBOARDING / DRY-RUN GATE

DESIGN SPEC · DESKTOP 1440

Findings during setup build trust
Surfacing the stale-oracle window (and explaining it) demonstrates value before the first alert — the product already "did security work" during signup.

Cost stated before the run
Pass-through RPC cost disclosed upfront; hidden costs are the fastest way to lose a technical buyer's trust.

Arming is a separate, final step
Routing (step 4) configures who hears about problems before anything can actually go wrong — prevents the day-one-no-alerts churn.
